

Abstract of the Disclosure

A system for defining, implementing, and maintaining geographically disperse Internet Service Providers (ISP) from a centralized processing center. Customers of ISP are provisioned services that include, but are not limited to, internet access, e-mail access, and web-hosting space. System provides ability to define flexible service offerings at price points dependant on disparate market conditions. Further, the system generates billing data based on specified service offerings that is aggregated and presented to the customer in a formatted bill in local currency and in accordance to local customs. Collection for services rendered is performed by the system in conjunction with third party processing systems in local currencies.
